

# **Appendix 10-1: Lake Okeechobee Operating Permit Annual Report for Water Year 2008**

David Unsell

Submitted to the Florida Department of Environmental  
Protection by the South Florida Water Management District,  
March 1, 2009, In Fulfillment of Permit Number  
0174552-001-GL Section 14, by David Unsell, P.E.,  
Project Administrator

---

## INTRODUCTION

---

The Lake Okeechobee Operating Permit (0174552-001-GL), herein referred to as the Permit, was issued under the authority of the Lake Okeechobee Protection Act (LOPA), Chapter 373.4595, Florida Statutes (F.S.), and Title 62, Florida Administrative Code (F.A.C.). This annual report is submitted by the South Florida Water Management District (SFWMD or District) to the Florida Department of Environmental Protection (FDEP) to fulfill the requirements of Specific Condition 14, Annual Monitoring Reports. This report includes two sections: (A) *Water Quality Data*, which includes data collected to meet the requirements of this permit during Water Year 2008 (WY2008) (May 1, 2007–April 30, 2008), and (B) *Performance Evaluation*, which includes an analysis of these data for Class I water quality exceedances, total phosphorus loadings, data collected within Lake Okeechobee under the Lake Okeechobee Research and Monitoring Plan, and applicable records from the ambient pesticide and herbicide monitoring data. Supporting data are also provided within this report in Appendices 1–11.

---

## A. WATER QUALITY DATA

---

### MONITORING INFORMATION RECORDS

An appendix of all water quality samples, including flagged samples, collected at Lake Okeechobee structures (**Figure 1**; **Table 1**) was developed from the District's hydrometeorological database, DBHYDRO (Appendix 1). These records include analytical results of grab samples taken throughout the year for 17 parameters required in the Permit (**Table 2**). Additional flood control backpumping monitoring at S-2 and S-3 is included (**Table 3**). Daily flow data (Appendix 2) and daily rainfall data (Appendix 3) are also reported.

The appendices of water quality incorporate the Permit-required data and metadata that include: (1) date, location, and time of sampling or measurements; (2) person responsible for performing the sampling or measurements; (3) date analyses were performed or the appropriate code as required by Chapter 62-160, F.A.C.; (4) laboratory/person responsible for performing the analyses; (5) analytical methods used, including Method Detection Limit (MDL) and Practical Quantitation Limit (PQL); (6) results of such analyses, including appropriate data qualifiers and all compounds detected; (7) depth of sampling (for grab samples); and (8) flow conditions and weather conditions during sample collection.

### FLOW DATA

Flow data were downloaded from DBHYDRO (Appendix 2). Flows that are used in the development of the total phosphorus (TP) loads for each structure are included in this appendix. Flow monitoring data are not currently available at Inflow 1, Inflow 2, Inflow 3, HP7, L-61E, and S-154C. The necessary monitoring equipment has been installed at S-154C and has been operational since May 2008. A new monitoring site (C41H78) has been constructed along the Harney Pond Canal to represent water quality parameters and flow from the following permit sites: Inflow 1, Inflow 2, Inflow 3, HP7, and L-61E. This site is operational (as per earlier agreement between the FDEP and SFWMD). Flow information is not currently available for this site because flow rating curves have not been completed. CU-5 data are available only from October 7, 2007–March 12, 2008. Structures S-2 and S-351, and structures S-3 and S-354 share

common preferred flow data. Flow into the lake at these locations occurs through S-2 and S-3, while flow out of the lake occurs at S-351 and S-354. Data for all existing rainfall stations (Appendix 3) are included with preferred data being listed where available.

During WY2008, flow volume to Lake Okeechobee was just over 1 million acre-feet (ac-ft) (**Table 4**). This is less than half the baseline period (1991–2000) of 2.2 million ac-ft. Higher flow volumes over 100,000 ac-ft occurred in the months July–October 2007 and in April 2008. The three largest contributors of water were S65E, CU-10A, and S-308. During this year, water levels reached record minimum values for a given date from July 3, 2007–March 18, 2008.

The District increased water restrictions to a modified Phase III level, which required a reduction of water use by agriculture, nurseries, and golf courses by 45 percent and allowed only one day a week for residential watering. This restriction resulted in a reduction of outflows from Lake Okeechobee to 177,000 ac-ft, which is approximately 15 percent of the baseline period (1991–2000) period of 1.2 million (**Table 5**). A majority of the discharges (60 percent) went to the Everglades Agricultural Area. On April 18, 2008, water restrictions were relaxed through most of the District, allowing residential irrigation twice a week.

## **S2-S3 PUMPING EVENTS**

One pumping event occurred at S-2 in WY2008 from February 13-15, 2008. Two auto-sampler and two grab samples were collected on February 14 and 15 (**Table 6**). TP concentrations were between 0.9 and 0.17 milligrams per liter (mg/L), while total nitrogen was between 3.9 and 7.4 mg/L with approximately half of this being nitrate + nitrite. Dissolved oxygen was below the Class I criteria of 5, while pH was within the Class I criteria of 6 to 8.5.

**Figure 1.** Location of structures included in the Lake Okeechobee Operating Permit.

**Table 1.** Structures monitored for compliance with Permit Number 0174552-001-GL.

| Structure          | Into/<br>From | Structure Description                                                                        | Latitude    | Longitude   |
|--------------------|---------------|----------------------------------------------------------------------------------------------|-------------|-------------|
| S-2                | Into          | Four unit pump station, 3,600 cfs                                                            | 26 41 58.81 | 80 42 48.09 |
| S-3                | Into          | Three unit pump station, 2,670 cfs                                                           | 26 41 56.24 | 80 48 26.21 |

## **B. LAKE OKEECHOBEE OPERATING PERMIT CLASS I WATER QUALITY PERFORMANCE EVALUATION**

---

The parameters included in the Lake Okeechobee Operating Permit that also have Class I criteria include alkalinity, biochemical oxygen demand (BOD), dissolved oxygen (DO), pH, specific conductivity, turbidity, and total iron (**Table 7**). Two parameters, turbidity and conductivity, are based on natural background values. To determine these values for Lake Okeechobee tributaries, all monitoring data collected from 1991–2000 were summarized to determine the median value (where 50 percent of the samples were greater and 50 percent less than that value). This period was used in order to be consistent with the baseline period (1991–2000) for the Lake Okeechobee Protection Plan (SFWMD et al., 2007). The median values were considered the natural background. For conductivity, this value was 483  $\mu\text{mhos/cm}$  ( $N = 4,532$ ). The estimated exceedance value based on this natural background is 741  $\mu\text{mhos/cm}$ . Because this value is less than the default criterion of 1,275  $\mu\text{mhos/cm}$ , the default criterion was used. The median value for turbidity was 3.3 NTUs ( $N = 4,657$ ), which when added to the criterion base value of 29, produces a turbidity criterion of 32.3 NTUs.

The water quality data for each station were separated into three categories – inflow, outflow (reverse flow), and no flow – where appropriate. These categories were determined primarily from daily flow measurements, where available, (Appendix 2) or secondarily from visual inspection records (Appendix 1). All fatally flagged measurements (J3 and J5) were removed from this analysis. All measurements below the detection limit were set to half of the detection limit. The mean, maximum, minimum, number of samples, standard deviation, and number of exceedances from Class I standards (where applicable) were determined for each structure for each given flow period (Appendices 4 through 6). The samples that exceeded the Class I criteria were tabulated (Appendix 7).

A binomial hypothesis test was used to determine if there was a greater than 10 percent excursion rate of Class I standards ( $H_0: f \leq 0.10$ ;  $H_A: f \geq 0.10$ ) (Weaver and Payne, 2005). This excursion rate is given a category of concern (**Table 8**). Due to drought conditions, fewer than normal inflow and outflow measurements were made in WY2008. Because all the flow and structure sample sets contained fewer than 28 samples (the cutoff at which the Type II error rate is greater than 20 percent for the binomial test), a preliminary evaluation was used based on the percent excursions greater than 20 percent (concern), between 0 and 20 percent (potential concern), and 0 percent (no concern).

To more accurately evaluate the excursion rate, a longer 10-year period of record (WY1998–WY2008) was used for the binomial hypothesis testing. The categories for the tests included “concern” ( $H_A: f \geq 0.10$ ), “potential concern” ( $H_A: 0.05 \leq f < 0.1$ ), “minimal concern” ( $H_A: 0 < f < 0.05$ ), and “no concern” ( $H_0: f=0$ ) (**Table 8**). The results for each 10-year analysis, including the mean, standard deviation, median, 25<sup>th</sup> and 75<sup>th</sup> percentiles, maximum and minimum values, percent excursions, and 90 percent confidence interval, are included in Appendix 8.

### **DISSOLVED OXYGEN AND BIOCHEMICAL OXYGEN DEMAND**

The Class I criteria for DO specifies that values shall not be less than 5 mg/L. DO was sampled at 12 structures during inflow events (**Table 9**). All these structures (CU-10A, CU-5, INDUSCAN, L-60E, S-154C, S-191, S-2, S-4, S-65E, S-71, S-72, and S-84) were listed as a concern. For the 10-year analysis, nine (CU-5, C-38W, L-60W, L-61E, S-127, S-129, S-131, S-133, and S-135) were listed as a concern, while the remaining 16 structures where measurements were taken were listed as a minor concern. Most excursions from the Class I criteria for WY2008 occurred from July–October when the higher water temperatures reduce the oxygen carrying capacity of the water.

For the no-flow condition, six (S-154C, S-351, C-38W, S-65E, S84, and S-354) were listed as no concern (**Table 10**). Six structures (C41H78, S-135, S-154, S-191, S-4, and S-71) were listed as a potential concern. The remaining 17 stations, with the exception of Industrial Canal which had no samples taken in WY2008 for this flow condition, were classified as a concern. For the 10-year period, four structures (CU-10A, S-154C, S-351, and Industrial Canal) were listed as a concern, two (C41H78 and S-354) as a potential concern, and the remaining 23 structures were listed as a minor concern.

DO was sampled at six structures during outflow events (**Table 11**). Of these structures, one (CU-5) was listed as a concern, four (C-38W, CU-10A, Industrial Canal, and L-61E) were listed as no concern, while one (S-352) was listed as a potential concern. For the 10-year period of analysis, four structures (L-59W, L-60W, L-61E, and S-154C) were listed as no concern, two (CU-10A and Industrial Canal) as a minor concern, one (S-352) as a potential concern, and nine (CU-5, C-38W, L-59E, S-127, S-129, S-131, S-135, S-351, and S-354) as a concern.

BOD5 measurements were collected under this Permit's requirements at structures S-308 and S-77 beginning as of December 31, 2007. Nine measurements were made at each structure from December 2007 through April 2008. Of these measurements, only one was above the MDL. This was at S-77 on February 20, 2008 (see Appendix 1).

## ALKALINITY AND pH

The Class I criteria for alkalinity specifies that the value shall not be less than 20 mg/L CaCO<sub>3</sub> equivalents. For periods of inflow to Lake Okeechobee in WY2008, alkalinity was measured at 11 structures (CU-10A, CU-5, INDUSCAN, L-60E, S-154C, S-191, S-4, S-65E, S-71, S-72, and S-84), and no excursions were found (**Table 9**). For the WY1997–WY2008 analyses, two structures (L-59W and L-60E) were listed as a concern, one (L-59E) as a potential concern, four (S-65E, S-71, S-72, and S-84) as a minor concern, and the remaining 19 structures as no concern.

Of the 28 structures sampled during no-flow, no excursions were reported (**Table 10**). For the 10-year period of analysis, there was one structure (S-84) categorized as a concern, four (L-59W, L-61E, S-71, and S-72) as a minor concern, and the remaining 23 structures as no concern.

In WY2008, alkalinity measurements were made at only six structures (C-38W, CU-10A, CU-5, INDUSCAN, L-61E, and S-352) during outflow events, and there were no excursions at these structures (**Table 11**). For the 10-year period of record, two structures (S-154C and L-61E) were categorized as a concern, and the remaining 10 structures (C-38W, CU-10A, CU-5, INDUSCAN, L-59E, L-59W, L-60W, S-351, S-352, and S-354) were listed as no concern.

The Class I criteria for pH specifies that the value shall not be below 6.0 or above 8.5 standard units. For the inflow condition, there were only two structures (S-191 and S-84) listed as a potential concern (**Table 9**). No excursions were found at the other 10 structures that were measured during inflow events. For the 10-year period, two structures (L-59E and L-61E) were classified as a potential concern, seven (CU-10A, L-59W, L-60E, S-191, S-65E, S-71, and S-84) as a moderate concern, and the remaining 16 structures as no concern.

For the no-flow condition, there was one structure (C-38W) was listed as a concern, four (L-60W, S-135, S-191, and S-71) that were listed as a potential concern, and the remaining 23 structures were listed as no concern (**Table 10**). For the 10-year period, there were two structures (S-65E and S-84) categorized as a potential concern, 11 structures (C41H78, CU-10A, INDUSCAN, L-59W, S-127, S-133, S-154C, S-2, S-236, S-351, and S-354) as no concern, and the remaining 16 structures as a minor concern.

For the outflow condition in WY2008, one structure (C-38W) was listed as a concern (**Table 11**). No excursions were found at the five other structures measured (CU-10A, CU-5, INDUSCAN, L-61E, and S-352). For the 10-year period, one structure (C-38W) was listed as a concern, two structures (S-135 and S-351) were listed as a potential concern, three (CU-10A, INDUSCAN, and S352) as a minor concern, and the remaining 10 structures were listed as no concern.

## CONDUCTIVITY

Because the background value for conductivity was less than the default value of 1,275  $\mu\text{mhos/cm}$ , the Class I criterion for conductivity was set to less than 1,275  $\mu\text{mhos/cm}$ . For the WY2008 inflow period, two structures (CU-10A and S-84) were listed as a potential concern, and the remaining 10 structures' measurements during inflow conditions (CU-5, INDUSCAN, L-60E, S-154C, S-191, S-2, S-4, S-65E, S-71, and S-72) were listed as no concern (**Table 9**). For the 10-year period of record, two (C-38W and CU-10A) were listed as a concern, eight (L-59E, S-154, S-154C, S-191, S-2, S-236, S-3, and S-84) as a minor concern, and the remaining 15 structures as no concern.

For no-flow condition in WY2008, five structures (C-38W, S-154, S-154C, L-59E, and S-2) were listed as a concern, three (S-191, S-236, and S-3) as a potential concern, and the remaining 20 structures sampled were listed as no concern (**Table 10**). For the 10-year period of record, two (C-38W and S-154C) were listed as a concern, two (S-352 and S-354) were listed as a potential concern, eight (L-59E, S-127, S-154, S-191, S-2, S-236, S-3, and S-4) were listed as a minor concern, and the remaining 19 structures as no concern.

For the outflow condition in WY2008, only one excursion was found (C-38W), which is listed as a concern (**Table 11**). The other five structures that were measured (CU-10A, CU-5, INDUSCAN, L-61E, and S-352) were listed as no concern. For the 10-year period, two (C-38W and S-154C) were listed as a concern, two (CU-10A and INDUSCAN) were listed as a minor concern, and the remaining 12 structures were listed as no concern.

## TURBIDITY

The Class I criterion for turbidity was based on the calculated background turbidity for Lake Okeechobee tributaries, which was not to exceed 32.3 NTUs. For the inflow condition, there were two structures (CU-10A and INDUSCAN) listed as a potential concern, and the nine others measured (CU-5, L-60E, S-154C, S-191, S-4, S-65E, S-71, S72, and S-84) listed as no concern (**Table 9**). For the 10-year period, two (L-59E and S-2) were listed as a concern, one (S-133) as a potential concern, five (CU-10A, INDUSCAN, S-154C, S-191, and S-84) as a minor concern, and the remaining 18 structures as no concern.

For the no-flow condition, two structures (C-38W and S-352) were listed as a concern, one (L-59E) as a potential concern, and the remaining 25 structures as no concern (**Table 10**). For the 10-year period, one (Culvert 10A) was listed as a concern, 12 structures (C-38W, CU-5, L-59E, L-61E, S-135, S-154, S-191, S-2, S-3, S-352, S-4, and S-84) were listed as a minor concern, and the remaining 16 structures as no concern.

For outflows in WY2008, three structures (S-352, CU-10A, and C-38W) were listed as a concern and the remaining three (CU-5, INDUSCAN, and L-61E) were listed as no concern (**Table 11**). For the 10-year period, two (C-38W and INDUSCAN) were listed as a concern, two (S-351 and S-354) were listed as a potential concern, two (CU-10A and S-352) were listed as a minor concern, and the remaining 10 structures were listed as no concern.

## IRON

The Class I criterion for total iron is not to exceed 1 mg/L. While not toxic at this level, the criterion is primarily to prevent staining in clothes washing. Because this parameter is only measured quarterly, there are not enough samples for a given station and flow to perform a binomial test with any accuracy for the 10-year period. For WY2008 inflow, only seven structures were measured (CU-10A, INDUSCAN, S-154C, S-4, S-65E, S-71, and S-84), and there were no excursions found at any structure (**Table 9**). For the 10-year period of record, one (S-154) was listed as a concern, eight (CU-10A, INDUSCAN, L-59E, L-59W, S-154C, S-191, S-2, and S-84) were listed as a potential concern, one (S-65E) was listed as a minor concern, and the remaining 14 structures were listed as no concern.

During the no flow periods, two (S-352 and S-154) were listed as a concern, and the remaining 26 structures as no concern (**Table 10**). For the 10-year period, two (S-352 and S-154) were listed as a concern, four (CU-5, L-60E, S-133, and S-84) as a potential concern, two (S-2 and S-3) as a minor concern, and the remaining 21 structures as no concern.

During outflow periods, measurements were taken at two structures (INDUSCAN and S-352), where no excursions were found (**Table 11**). For the 10-year period, three structures (CU-10A, S-352, and S-354) were listed as a concern, one (INDUSCAN) as a potential concern, and the remaining nine structures as no concern.

## PHOSPHORUS LOADS

The five-year average (WY2004–WY2008) total phosphorus load to Lake Okeechobee is 558 metric tons per year (**Table 12**). This includes an estimated 35 metric tons from atmospheric deposition. This five-year average also includes two very high flow years that were influence by Hurricanes Charley, Frances, Ivan, and Jeanne (in WY2005) and Wilma (in WY2006). The WY2007 and WY2008 loads were much lower (203 and 246 metric tons, respectively) due to low-flow conditions caused by the region-wide drought conditions in the past two years. Further analysis of these loads can be found in Chapter 10 of this volume.

## PESTICIDE MONITORING PROGRAM

The District maintains a pesticide monitoring program that evaluates for over 60 pesticides and/or products of their degradation on a quarterly basis at 34 locations (Pfeuffer, 2007). This program monitors the following six tributary sites to Lake Okeechobee: FECSR78, S-65E, S-191, S-2, S-3, and S-4. Sample analyses of surface water and sediment for these sites are included in Appendices 9 and 10, respectively. The quarterly reports can be found at the District's web site at [www.sfwmd.gov](http://www.sfwmd.gov), under the *What We Do, Environmental Monitoring, Reports* section (*Pesticide* tab). See also Chapter 10 of this volume.

## IN-LAKE WATER QUALITY MONITORING

The District maintains 37 in-lake sampling stations to monitor water quality in all regions of the lake (**Figure 2**). The effects of nutrient loading, high and low water levels, droughts, and hurricanes on trends and changes in water quality have been evaluated using this information (Havens and James, 2005; James and Havens, 2005; Zhang et al., 2007; James et al., 2008) Chapter 10 of this volume also includes a detailed evaluation of these data. An appendix of all water quality samples collected at Lake Okeechobee structures (see **Figure 2**) was developed from DBHYDRO (Appendix 11). These records include analytical results of grab samples taken throughout the year for 15 of the 17 parameters (**Table 2**). No samples were taken for BOD or total iron.

**Table 7.** Class I criteria values for Lake Okeechobee monitoring.

| Parameter                 | Units                   | Criteria                                                                                                                                                                                                       |
|---------------------------|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Alkalinity                | mg/L                    | $\geq 20$                                                                                                                                                                                                      |
| Biochemical Oxygen Demand | mg/L                    | Shall not be increased to exceed values which would cause dissolved oxygen to be depressed below the limit established for each class and, in no case, shall it be great enough to produce nuisance conditions |
| Dissolved Oxygen          | mg/L                    | $\geq 5$                                                                                                                                                                                                       |
| pH                        | SU                      | <b>6 - 8.5</b>                                                                                                                                                                                                 |
| Specific Conductivity     | $\mu\text{S}/\text{cm}$ | $\leq 1275$ or $\leq 1.5 * \text{natural background}$ (whichever is greater)<br><b><math>\leq 1275</math></b>                                                                                                  |
| Turbidity                 | NTU                     | $\leq 29 + \text{natural Background}$<br><b><math>\leq 32.3</math></b>                                                                                                                                         |
| Total Iron                | $\mu\text{g}/\text{L}$  | <b><math>\leq 1,000</math></b>                                                                                                                                                                                 |

**Table 8.** Excursion categories for Class I water quality tests (adapted from Weaver and Payne, 2005).

| Excursion Category | Class I Water Quality Binomial Test | Preliminary Analysis of Class I Water Quality % Exceedances (less than 28 samples) |
|--------------------|-------------------------------------|------------------------------------------------------------------------------------|
| Concern            | $> 10\%$                            | $> 20\%$                                                                           |
| Potential Concern  | 5 to 10%                            | $> 0\%$ and $< 20\%$                                                               |
| Minimal Concern    | $0\% < \text{and} < 5\%$            | N/A                                                                                |
